

N-BIRR

National Brain injury rescue and rehabilitation project

Using ANAM [Automated Neurologic Assessment Metrics], the bar graph represents 6 parameters being tested. Within each field there are 4 bars:

Dark blue-premorbid

Red: post trauma

Green: after 40 treatments at 1.5ATA [which is mild pressure. ~16ft below sea level with 100% oxygen]

Light blue after 80 treatments

Of particular interest is the profound drop in functionality to procedural reaction time, such that both treatment arms achieved an improvement beyond the premorbid state. PERHAPS there was occult injury prior? Bottom line: This modality of therapy is safe and effective

Airman B ANAM Percentile Scores
